

MyGengo plugin for Wordpress – User guide

This is a short guide on how to use the myGengo plugin for wordpress.

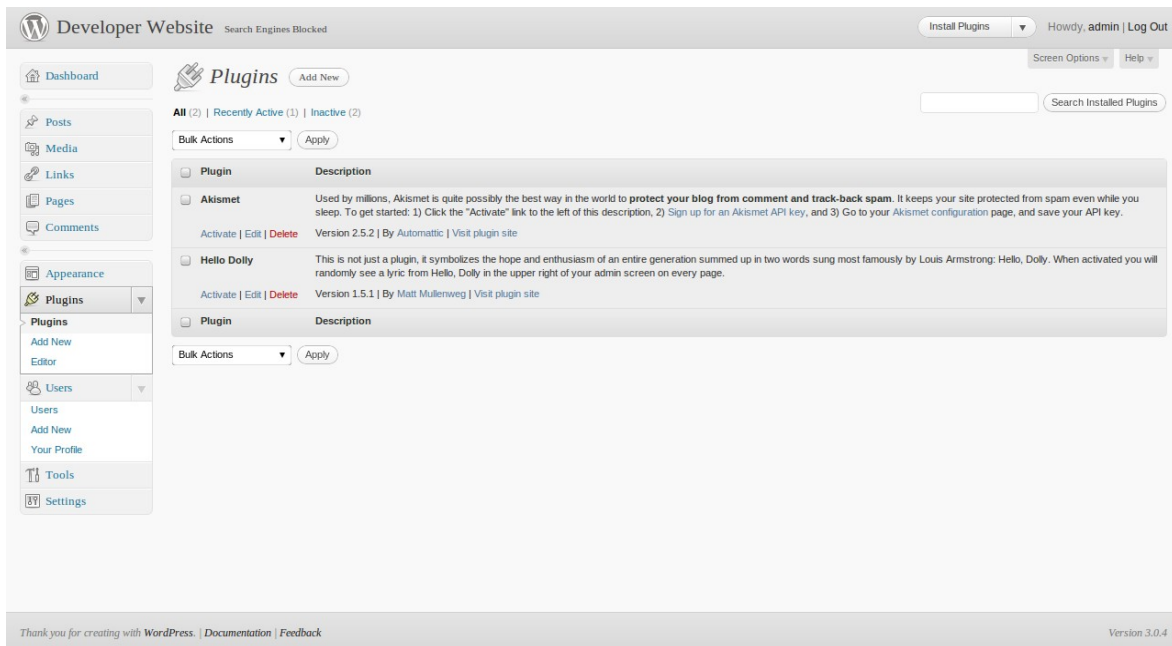

A demo on this tutorial can be found at <http://www.pamahres.com/wordpress>.

To login, the username is 'admin' and the password 'd3m04dm1n'.

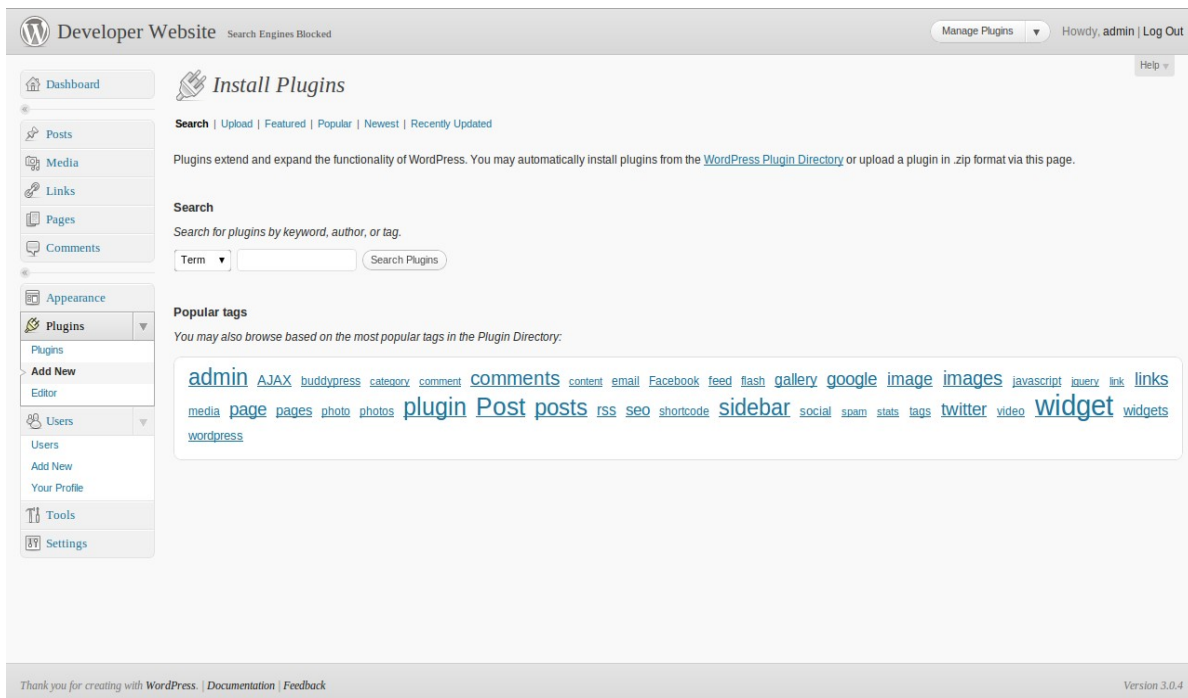

Tested with wordpress 3.0.4

1 Installation

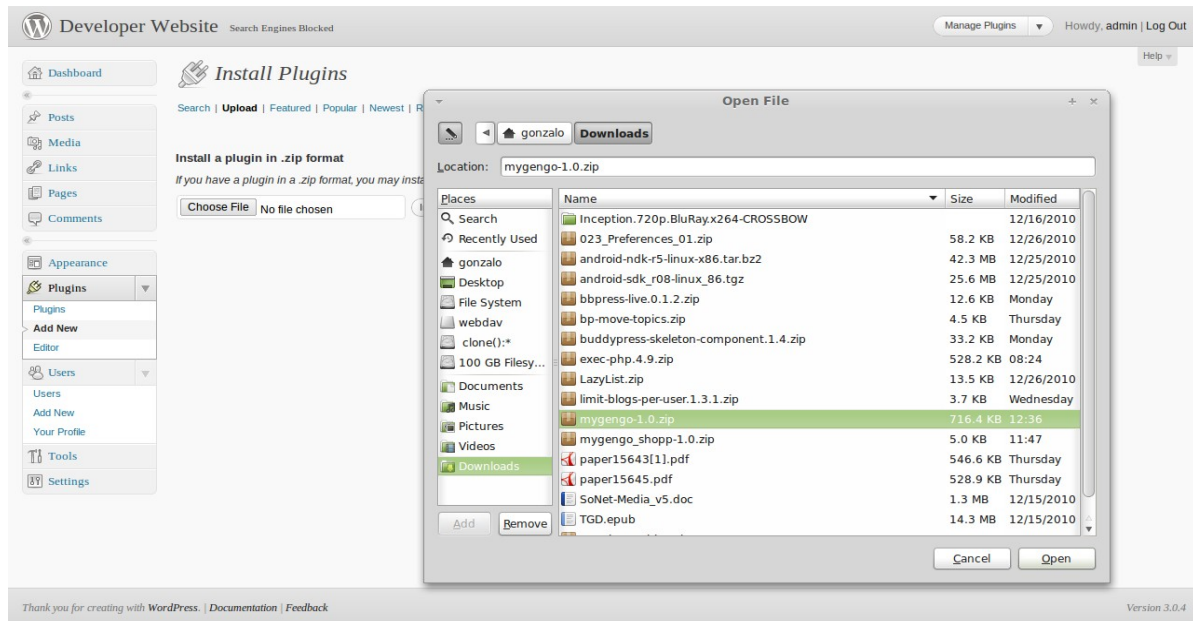

To install myGengo for wordpress, go to the administration of your blog, and open the ‘Plugins’ section.

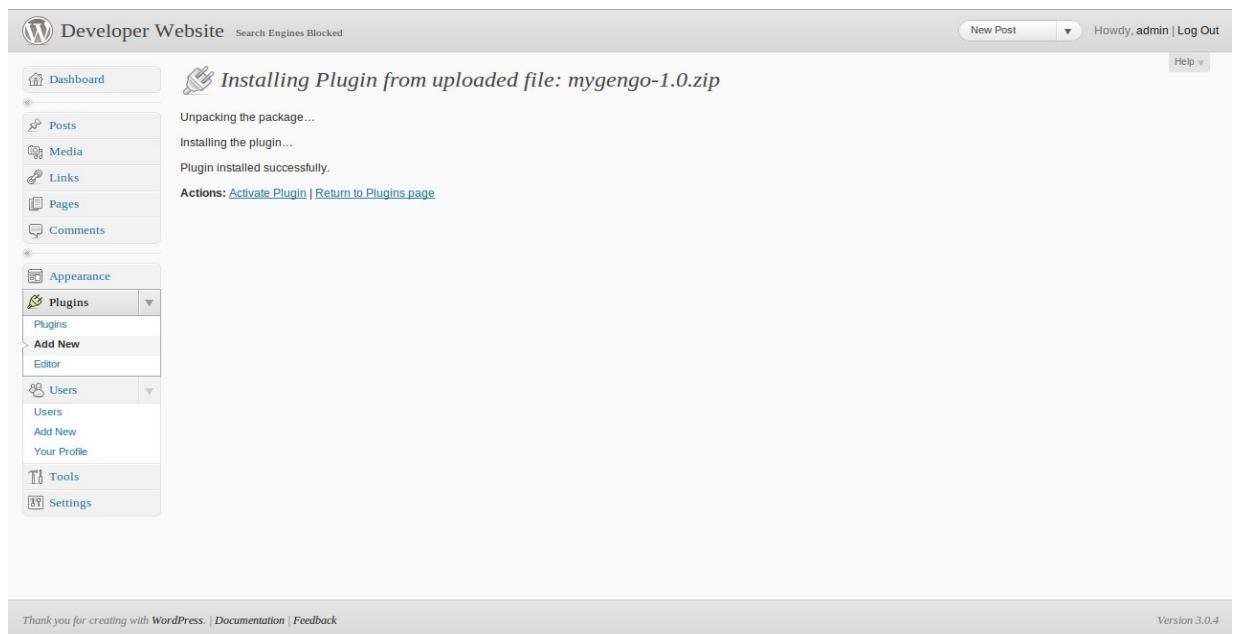

Then click on the ‘Add New’ button.

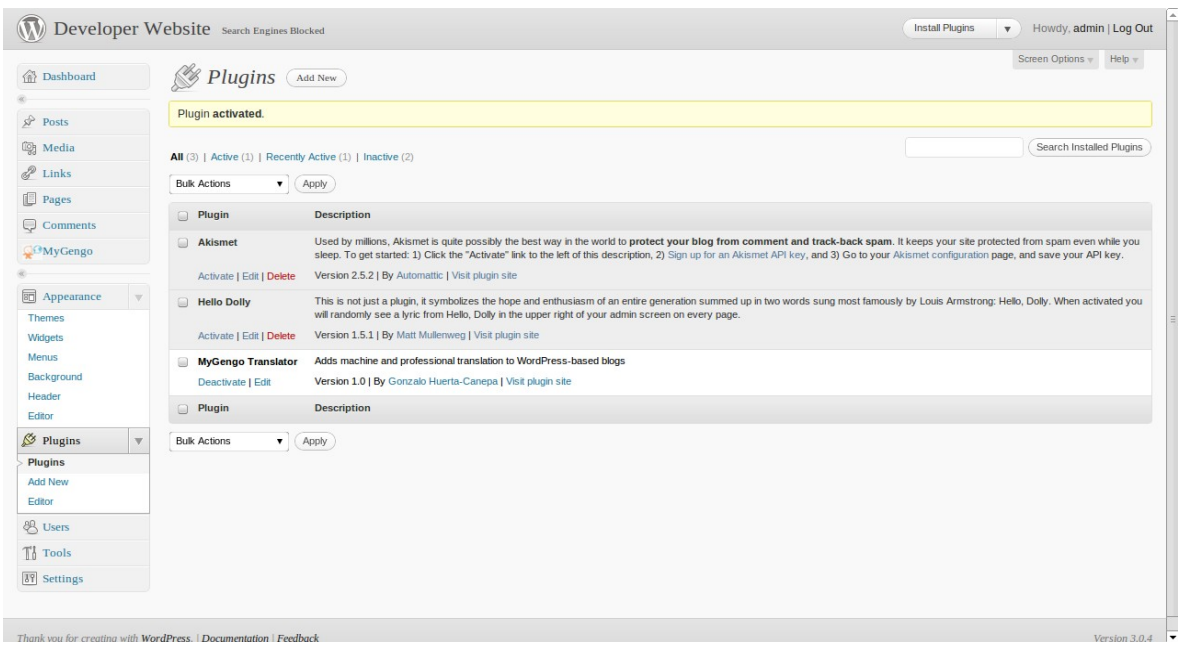

And then on the 'Upload' button. Once on that page, click 'Choose File' and select the file containing the myGengo plugin (mygengo-1.0.zip in our case). Then add the plugin by clicking the 'Add' button.

Once the plugin is uploaded you can select to Activate it immediately. If you choose to do so, click on the 'Activate plugin' link.

If everything goes fine, you will see a message saying that the plugin was activated and you are ready to use it.

2 Initializing the plugin

Before using the myGengo plugin, you need to add the keys to use it. You can get keys for the plugin at <http://mygengo.com>

There are two options for adding the keys on this plugin. Each user can add her own set of keys, or the administrator can add a public set of keys that can be used by any contributor of the blog. If you choose the former, we need to add the keys in the 'MyGengo' section of the administration page, specifically in the 'Personal Settings' page. There are several options on this page:

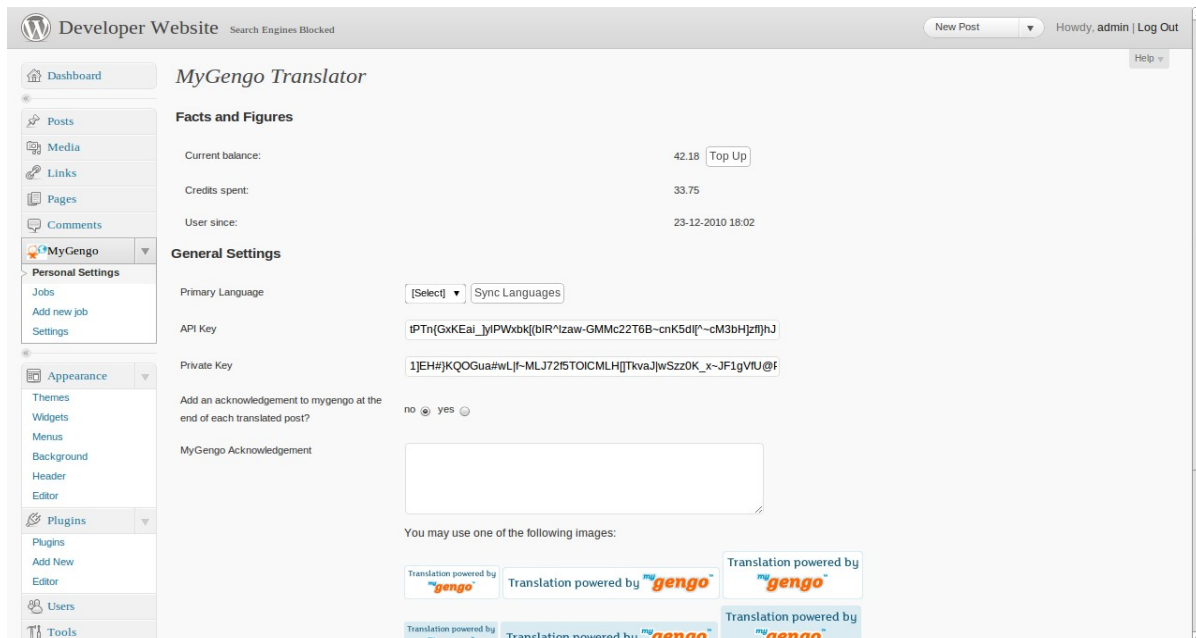

- Primary language means the primary language for the current user.
- API and Private keys are the set of keys for myGengo
- The acknowledgement section is used to add text at the end of translated texts, IF published using the interface.

For all the options to work, you need to enter your keys first and then save the settings.

The screenshot shows the WordPress administrator interface for a 'Developer Website'. The left sidebar contains a menu with options: Dashboard, Posts, Media, Links, Pages, Comments, MyGengo (selected), Personal Settings, Appearance, Plugins, Users, Tools, and Settings. The main content area is titled 'MyGengo Translator' and contains the 'General Settings' section. This section includes a 'Primary Language' dropdown menu (currently set to '[Select]') with a red warning message: 'You have to update the API and private keys to use the plugin'. Below this are input fields for 'API Key' and 'Private Key'. A button labeled 'Create an account!' is present with the instruction: 'Click the button if you do not have a myGengo account yet'. There is a checkbox for 'Add an acknowledgement to mygengo at the end of each translated post?' (currently set to 'no'). A text area for 'MyGengo Acknowledgement' is provided. Below the text area, a message states 'You may use one of the following images:' followed by a grid of six 'Translation powered by mygengo' logos in various colors and sizes. At the bottom, a message states 'You may use these HTML tags and attributes:' followed by a list of HTML tags: , <abbr title="">, <acronym title="">, , and <blockquote cite="">.

After you enter and save your keys, you will see two new elements:

- A section with the details of the account (balance, credits spent)
- A button to retrieve and sync the languages from the mygenko servers. You can press this button to retrieve the available languages and then choose one as your default language.

This is all you need to do as a user. Now, let's see the administrator's interface.

The interface is quite similar, but there are a couple sections that are of interest:

- You can create a user under whom the translations will be published.
- You can also serve translation based on users' browser language. This is a beta feature and it is not recommended to use so far, since it blocks the content in other languages.
- You can allow other users to use the public keys defined in this section

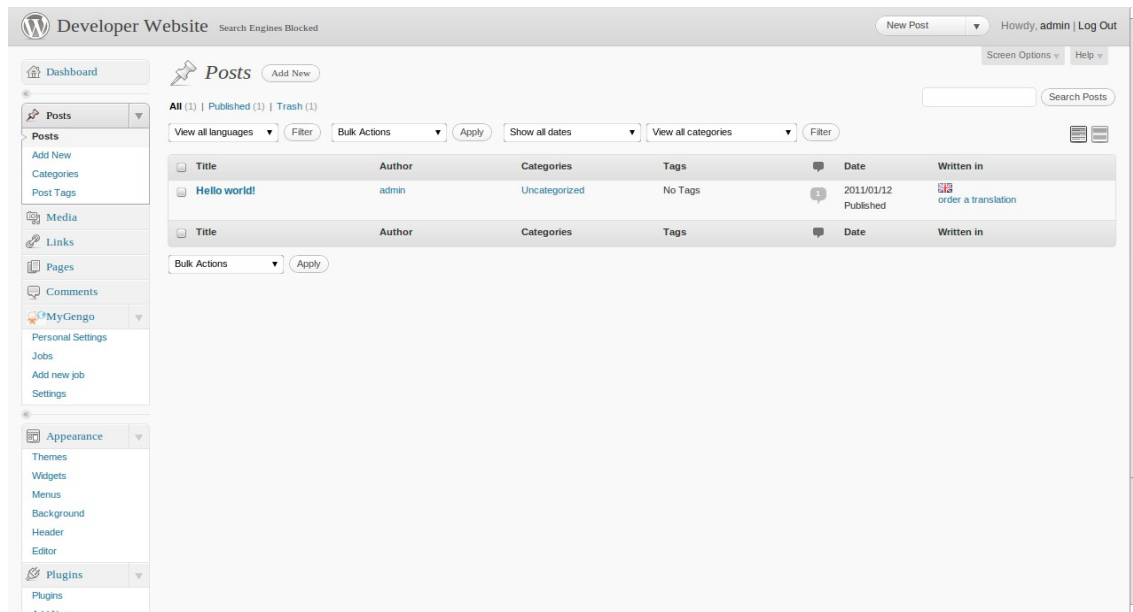

The screenshot shows the 'MyGengo Translator' settings page within a WordPress dashboard. The left sidebar contains navigation links: Dashboard, Posts, Media, Links, Pages, Comments, MyGengo (selected), Personal Settings, Jobs, Add new job, Settings, Appearance (Themes, Widgets, Menus, Background, Header, Editor), Plugins (Add New, Editor), Users, and Tools. The main content area is titled 'MyGengo Translator' and 'General Settings'. It includes several configuration options: 'Primary Language' set to 'English' with a 'Sync Languages' button; a toggle for 'When published, add the post/page as authored by a user called "mygengotranslator"?' set to 'yes'; a toggle for 'Automatically serve translation according to user's browser preferences?' set to 'no'; a toggle for 'Allow users to utilize common myGengo keys?' set to 'no'; input fields for 'API Key' and 'Private Key'; a 'Base Uri' field containing 'http://api.sandbox.mygengo.com/v1'; a 'Format' dropdown set to 'json'; a toggle for 'Add an acknowledgement to mygengo at the end of each translated post if using public keys?' set to 'no'; and a 'MyGengo Acknowledgement' text area.

IMPORTANT:

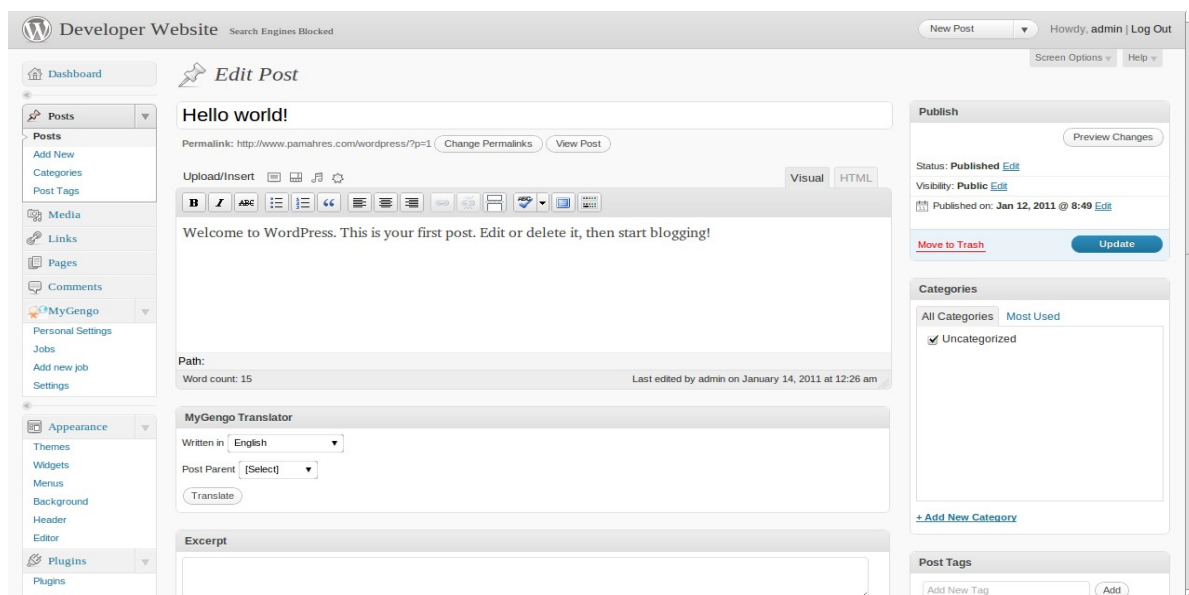

- In this section you can also select the target server. The current version of the plugin is predefined to use the SANDBOX server. So you need to change the URL here to use the production site.
- In this section you SHOULD add the instructions for the revision and the rejection of jobs. Textareas for these are located at the bottom of the page.

3 Adding a translation job

There are several ways to add a new translation job from the contents in the blog. You can add a new translation of a post , page or comment by clicking in the ‘Written in’ column located on their listings,

or you can click on the ‘Translate’ button located at the ‘MyGengo’ meta box at the post, page and comment edition,

or you can simply click on the ‘Add new job’ link at the MyGengo section in the administration.

The screenshot shows the 'MyGengo Translator' administration interface. The left sidebar contains navigation links: Dashboard, Posts (with sub-links: Posts, Add New, Categories, Post Tags), Media, Links, Pages, Comments, MyGengo (with sub-links: Personal Settings, Jobs, Add new job, Settings), Appearance (with sub-links: Themes, Widgets, Menus, Background, Header, Editor), and Plugins (with sub-links: Plugins, Add New). The main content area is titled 'MyGengo Translator' and features a 'Help' button. The 'Order Information' section includes fields for 'Insert job text from post' (set to 'Hello world!'), 'Insert job text from page' (set to '[Select]'), 'Source Language' (set to 'English'), 'Target Language' (set to '[Select]'), and 'Tier' (set to '[Select]'). Each field has an 'Add comments' link and an 'Assign' button. The 'Text to translate' section has a 'Title' field and a 'Your text' area. The 'Order' section on the right shows a balance of 42.18, estimated cost of \$, units of -, and estimated time of - hours. It also has checkboxes for 'Assign whole translation job to one person' and 'Auto-approve jobs'.

If you choose the latter, you can select a post or page, and assign it to the current job, by using the toolbar at the top of the Order Information.

After you add content to your order and selected the source and target languages and the tier, a ‘Get quote’ button will appear. You have to click it to get a quote and check if your credits are enough to pay the job.

This screenshot shows the 'MyGengo Translator' administration interface after some changes. The 'Order Information' section now shows 'Assigned to post ID 1'. The 'Source Language' is 'English' and the 'Target Language' is 'Japanese'. The 'Tier' is set to 'standard'. A 'my gengo Standard' logo is displayed with the text 'Fast human translation by a native speaker. For everyday use.' The 'Text to translate' section has a 'Title' field with 'Hello world!' and a 'Your text' area containing '[[[post_title_]]] Hello world!' and '[[[post_content_]]] Welcome to WordPress. This is your first post. Edit or delete it, then start blogging!'. The 'Order' section on the right remains the same, but a 'Get Quote' button has appeared at the bottom. The left sidebar is identical to the previous screenshot.

If you have enough credits, a button ‘Order & pay now’ will appear and you can pay for your job. If credits are not enough, a button with a link to the myGengo site will appear, so the user can add more credits to her account.

13519	Sat Jan 15 2011 12:52:12 GMT+0900 (KST)	available	English	Japanese	29	standard	

Job ID Ordered on Status Source Target Unit Count Tier

You can click on the ID of each job to check its status. This page displays the original text and language, and previews of translation and current translations and target language, if available. According to the status there are different actions you can perform:

- If the status is ‘available’, then it can be canceled by the user.
- If it is pending, then there is nothing to do but wait for a translation to review.
- When the status is ‘reviewable’ the user can approve, reject or request comments to a translation. More on this next.
- Finally, if the status is approved you can publish the translation. More on this next.

Besides, regardless of the status (except if the job is canceled or approved), you can add comments to this translation using the box located at the bottom.

After every change, the user will be taken back to the jobs’ list.

Add Comment

Job Information

Job status: pending

When the status of the job is ‘reviewable’, the user can approve the translation and add feedback for myGengo and for the translator. She also can reject the translation by clicking the ‘Reject’ button or request modifications by clicking the ‘Request Corrections’ button. In the latter cases, a new layer with the form to fill will appear. The user then must fill-up this form and submit the content.

4 Publishing a job

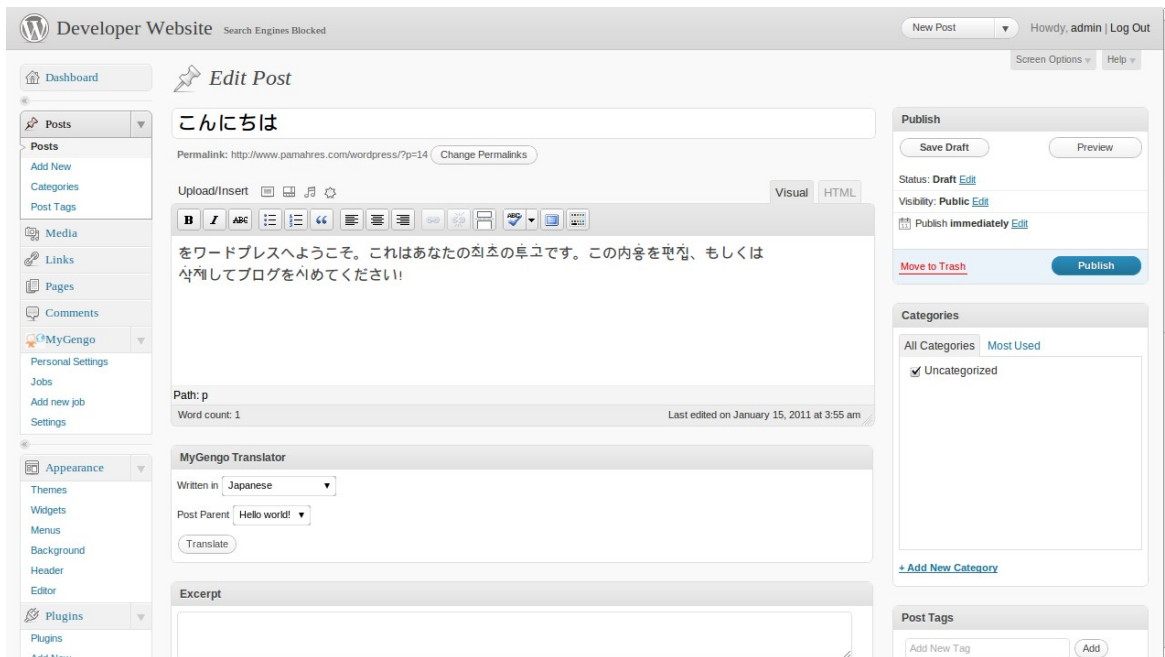

If a job was approved by the user, he can choose to leave the job in the DB only, or to publish it as some content in the blog. If he chooses the latter, this plugin provides the user with options on the right-hand side of the job preview page.

There are 2 default options:

- Publish as a new post
- Publish as a new page

As their name indicates, these two actions take the content of a job, and create a new post or page with it. After the new content is created, the user is redirected to the new content page.

The default behavior can be extended by the user by creating new TextSources.

A TextSource is a class that contains some methods that allow us to create new contents based on the job content. Moreover, these sources are the ones that parse the existing content to be in the form of a job.

The MyGengo plugin defined three main TextSources:

- PostTextSource (and PageTextSource): to manage the content from post and pages
- CommentTextSource: to manage comments
- DummyTextSource: to manage any other content

Each source defines a `post_type`, used to describe the content it can parse and create. The predefined types are 'post', 'page', 'comment'. You can use any other type, and it will be handled by the dummy text source.

In general terms, these classes implement the following functions:

- function `accept($post_type)`: that returns true if the source can handle the content type
- function `retrieveFormElements()`: used to display the assignment form at the order page
- function `getAssignedTo()`: that retrieves a label and hidden fields for the current assignment
- function `getTextToTranslate($requestvars)`: the text to be included in the job
- function `getPrimaryLanguage()`: the source language of the job
- function `getWordcount($unit)`: deprecated
- function `retrievePublishableAs($jobid)`: the new content that can be created with this source
- function `publishAs($jobid, $requestvars)`: to handle the publication

Once they are created, they can be added to the current sources by calling the `mygengo_registerTS` method, which just receives the name of the class to instantiate as a parameter.

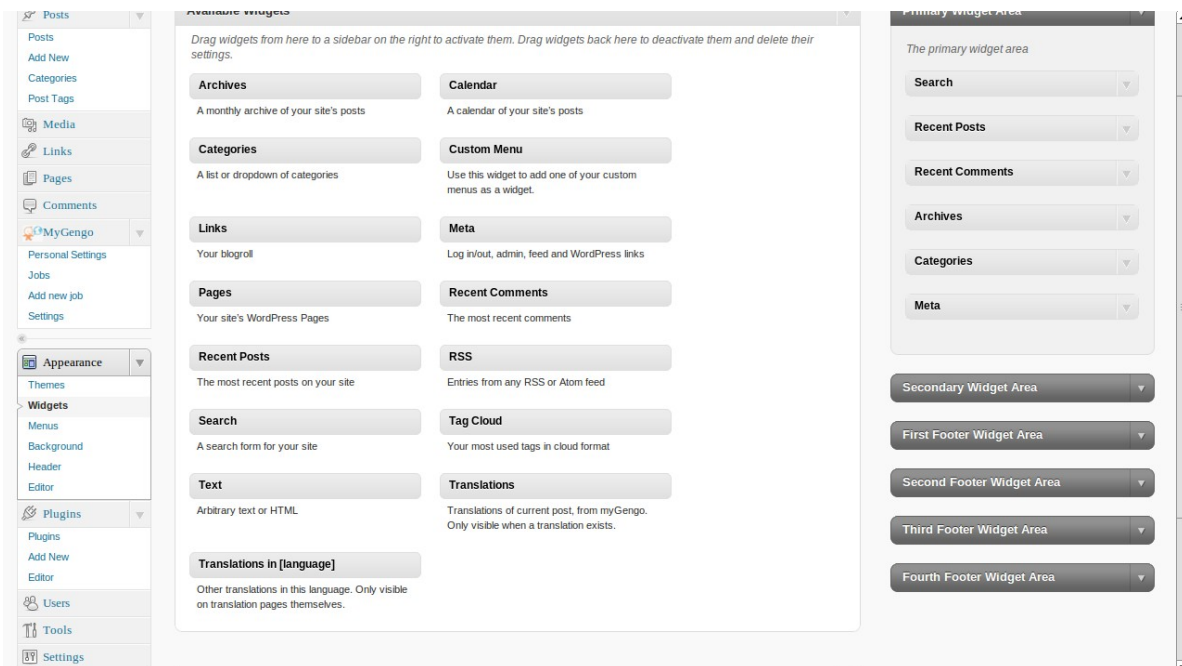

More details on how to add new sources will be added soon. In the meantime, the user can refer to the `mygengo-textsources.php` file for more details on implementation.

5 UI elements

This plugin contains son widget, short codes and functions to be used at the user interface.

5.1 Widgets

Go to Appearance > Widgets in the left sidebar of your Dashboard. Drag the two "Translations" widgets to your sidebar and click "Save Changes".

5.2 Short codes

The easiest way to integrate myGengo to your site is by adding short codes to your posts/pages or anything you want. Short codes not only allows you to display current translation for ANY section of your site, but also allows you to translate the same section.

There are two types of short codes:

1. ****mygengo_st**** that shows the translation to the element you desired
2. ****mygengo_t4e**** that allows you to add a translation to textarea

The former sort code can be used with any text inside a 'div' tag. This short code insert code that displays the available translations of the content inside the div, and allow users to order more translations. You only need to add something similar to the following short code next to your element:

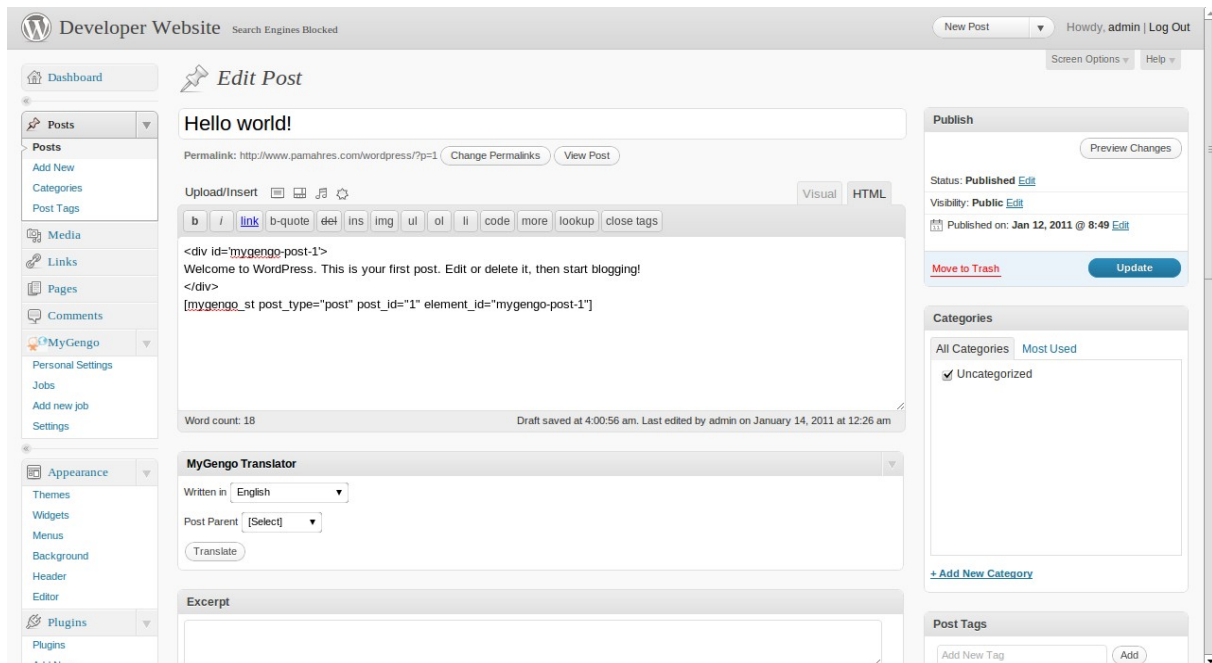

```
[mygengo_st post_type="post" post_id="0" element_id="" include_text="0"]
```

The arguments `post_type` and `post_id` allows the system to process properly the content. If you use one of the predefined types – post, page, comment – then if the user requests a translation, the system will read the content from the database. If the `post_type` is a custom one, then the user should set the `include_text` to 1. **The combination of the `post_type` and `post_id` uniquely defines a job** and therefore should be used carefully.

The `element_id` argument refers to the div that contains the text to be translated.

For example, if a user wants to display the content of a post in several languages, but does not want to publish the new translations, he can perform the following steps:

- Inside the original post, the user must add the short code, setting the id to the post id. Since this is part of the post and not the complete post, set the type to ‘post-content’ or any other not predefined name.
- Also, the content to be translated must be wrapped inside a div. This div should be identified with a unique id. This is will be the `element_id` argument.

- Then, at the post page, if the user clicks on the ‘Add a translation’ link located where she placed the short code, it will be taken to the new job page, with the content of the div. The user must follow the flow showed in section 3 to approve the job. After the job is approved, if the user goes back to the post page a flag with the translation should appear.

Add a comment for the translator (optional):

Order

Balance:

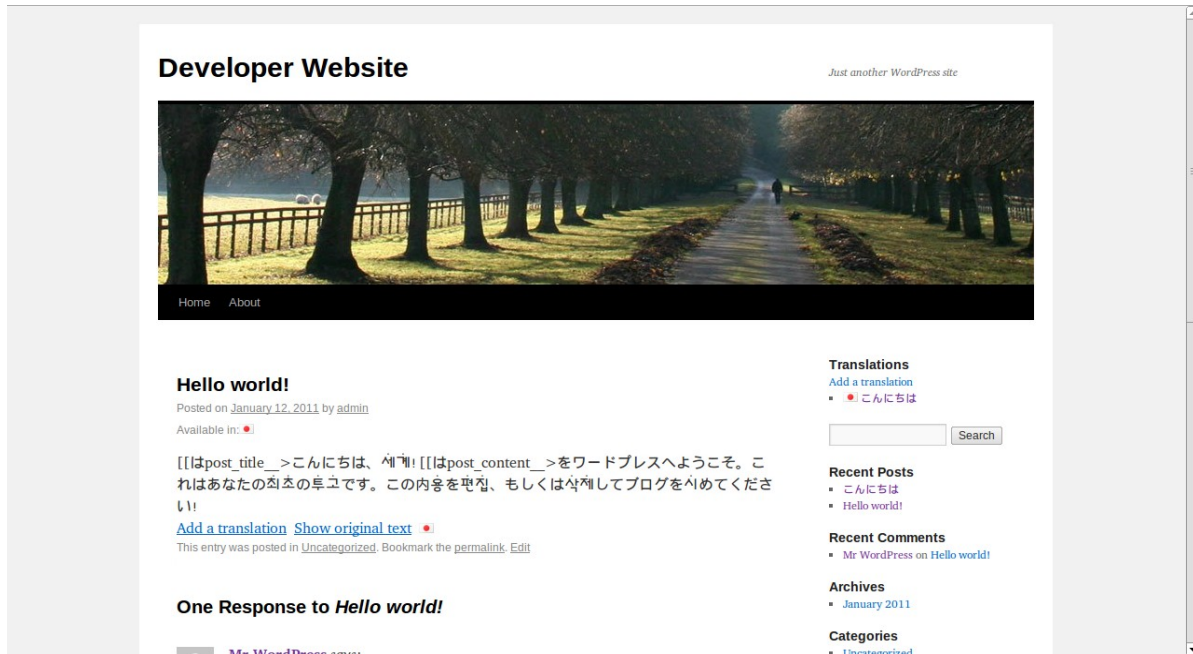

Estimated cost: \$

Units:

Estimated time: hours

☒ Assign whole translation job to one person
☐ Auto-approve jobs

- If the user clicks on the flag, the translation content will replace the original content.

This is very easy to do, but some users may prefer to add php code at the templates, to avoid writing the post id hardcoded at the post content. To do this, you have to include the following code in the Single Post file of the theme:

```
<div><?php if(function_exists('mygengo_translations_viewer')) {mygengo_translations_viewer($id, 'post-type', 'element_id', '1');} ?></div>
```

The second short code is used to add text to text areas. It is useful for replying comments in different languages. It works in a similar way to the previous short code, but:

- The element **MUST** be a text area
- The argument 'include_text' is not used

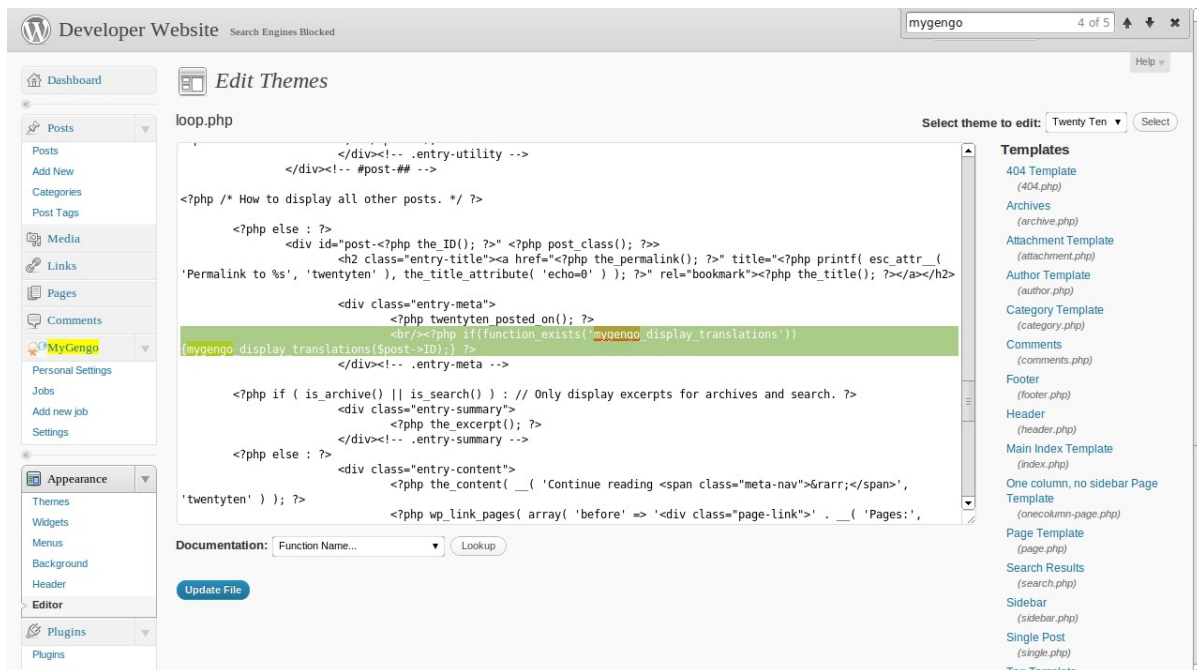

5.3 Functions for displaying translations

You can also add links to translations (based on translatemyblog code):

To display translation links under the title of the post (where they'll be more visible to users), go to Appearance > Editor, edit your Main Index Template (typically index.php or loop.php) and insert

```
<div><?php if(function_exists('mygengo_display_translations'))
{mygengo_display_translations($id);} ?></div>
```

before the line `<div class="entry">` or after the post title.

To display links back to the original post on the translation page (along with links to translations in other languages) edit your Single Post (single.php) template and insert

```
<div><?php if(function_exists('mygengo_display_translations'))
{ mygengo_display_translations($id); } ?></div>
<div><?php if(function_exists('mygengo_display_parent_link'))
{ mygengo_display_parent_link($id); } ?></div>
```

before the line `<div class="entry">` or after the post title.
